The article discusses the initial patterns that ensure the unity of the evolutionary process from the origin of life in the environment of non-living matter until its transformation in the nosphere. An analysis of literary sources shows that in the process of the development of thermodynamics and biology, by the middle of the last century, such many at first glance did not solve the contradictions that they set the unity of the world. The dynamics of the evolution of non-equilibrium dissipative media removes all existing contradictions between biology and thermodynamics, shows their initial unity, allows us to formulate physical conditions in the pre-biological period, which led to the birth of life.
