Do my Homework

If there are some stable preferences of users of the infocommunication network to work in certain areas of communication, the maintenance of used compounds, as traces of their activities, removes a priori uncertainty and ensures the continuous effect of the mechanism of advanced adaptation of network structures to variations in the subject and intensity of user requests.

The use of this approach that takes into account the manifestation of the inertness factor allows an additional resource without the costs to ensure continuous adaptation of the network to the targets of the overseystem, its actualization. At the same time, on the side of the overseystem, it is not necessary to control the state, nor the issuance of any control influences.
